

FIRST DRAFT WORKSHOP · PILOT IN DEVELOPMENT

Bring the app idea. Leave with a foundation you own.

A facilitated working session for people who know the problem they want to solve. Make the product decisions with your coding agent, compile a tested Rails foundation, and take the source with you.

Tell me when workshops open →

Dates and registration aren't open yet.

01 / THE METHOD

Not a giant prompt. A sequence of decisions.

What leaves the room

Not a pitch deck. Not a prototype trapped in someone else's account. A conventional starting point you can inspect and extend.

02 / OWNERSHIP

Built to be continued.

The generated code is the beginning of the work, not the end. Keep going with the agent that helped you design it, bring in a developer, or learn the system yourself.

A foundation, not a finished company.

- * The workshop helps you make product decisions; it does not replace ongoing product work.
- * Revyl is a preview lane, not proof of a physical-device install or App Store submission.
- * A future First Draft plan-review GUI and white-glove hosting are not part of this pilot.

03 / WHO IT'S FOR

You know the problem. You want a real starting point.

You do not need to arrive with a technical specification. You do need to be ready to make choices.

Founders	with a specific workflow or customer problem
Operators	who understand the process that software should support
Designers and builders	who want structure before polishing the interface
AppDev students	who learn better from a working system they can inspect

PILOT CTA — DESTINATION TO BE DECIDED

Bring the idea. We'll make the first draft together.

Workshop updates →

FIRST DRAFT · SKILL + CLI · INTERNAL ALPHA

From agent conversation to tested source.

Review the plan. Send it to First Draft. Download a conventional Rails foundation your agent can keep changing.

SKILL ACCESS — TBD  Not publicly released

01 / THE CONTRACT IS INSPECTABLE

The important choices exist before the code.

The Foundation Plan is a reviewable contract: records, actions, access, sample data, clients, and known gaps.

records entities + fields	actions user + system behavior	access roles + permissions	sample_data realistic fixtures	clients web + iOS + Android	gaps choices still unresolved
-------------------------------------	--	--------------------------------------	--	---------------------------------------	---

02 / ONE SERVICE BOUNDARY

No mystery ownership.

Your agent authors the plan. First Draft's backend compiles and verifies the foundation. The CLI downloads ordinary source into your environment. Your agent subscription and model tokens remain yours.

03 / WHAT ARRIVES

A legible handoff, not a disappearing act.

GENERATED SOURCE	VERIFIED ✓
└─ app/	
└─ config/	
└─ test/	
└─ ios/	
└─ android/	
└─ README.md	
└─ .firstdraft/compilation-record.json	

COMPILATION RECORD	
plan	submitted
analysis	reviewed
generation	complete
tests	passing
ownership	local
The record explains what was generated and what still needs attention.	

04 / FRONT END

Structure first. Taste still matters.

First Draft gets the domain model and client foundations into place. Bring interface explorations into the same agent session, then rework the front end in ordinary code. Basecoat is the design-system substrate.

The workshop is the first public path: shape a real idea, review the plan, compile the foundation, and make the next change.

Want to learn the whole sequence live?

STANDALONE RELEASE STATUS — TBD

Keep the plan visible. Keep the source yours.

SKILL ACCESS — TO BE DECIDED

APPDEV · DAY 1 EXPERIMENT

Start with something working. Then learn how it works.

Use First Draft to create the foundation on Day 1, then trace the models, routes, screens, native shells, and deployment choices as you make the next change yourself.

APPDEV NEXT STEP – TBD

DAY 01 / FOUNDATION LAB		ONE WORKING SESSION
09:00	FRAME idea → users → decisions	
10:00	PLAN records → actions → access	
11:30	COMPILE Rails → iOS → Android	
13:30	RUN local app → tests → preview	
15:00	CHANGE trace one behavior end to end	

01 / THE FIRST DAY

See the whole system before studying the parts.

A generated foundation makes the architecture concrete. Students can ask better questions because the records, routes, screens, tests, and clients are already visible.

01 Idea Name the user and workflow.	02 Plan Make domain choices explicit.	03 Compile Watch structure become source.	04 Run Use the actual system locally.	05 Change Trace one behavior end to end.
--	--	--	--	---

02 / WHAT YOU LEARN

The foundation is the beginning of the lesson.

Generation collapses setup time. It does not remove the responsibility to understand the system. Day 1 uses the output as a specimen: inspect it, follow it, change it, and explain the consequence.

DOMAIN MODEL	
A	How records and relationships express the problem
REQUEST PATH	
B	How an action moves through routes, controllers, models, and views
CLIENT SHAPE	
C	What web, iOS, and Android share—and what they do not
QUALITY SIGNALS	
D	How tests and the compilation record make assumptions visible

03 / THE ARTIFACT STACK

One idea, multiple representations.

Students learn to move between the product story and the structures that make it real.

01 PLAN The intended system, before generation	02 RAILS Domain logic, routes, screens, tests	03 WEB The browser-facing product surface	04 iOS A native client project	05 ANDROID A native client project	06 RECORD What compiled and what remains
---	--	--	---	---	---

04 / THE OUTCOME

From student to owner.

The goal is not to admire generated code. It is to understand enough of the foundation to make a considered change, explain it, and keep going after class.

END-OF-DAY CHECK	CAN YOU...
☐ explain the plan?	
☐ find the route?	
☐ trace the record?	
☐ change a behavior?	
☐ run the tests?	

If Day 1 works, the workshop is the next experiment.

Run the same sequence with founders and operators bringing real ideas: facilitate the decisions, generate the foundation, and teach the handoff.

DAY 1 CTA – DESTINATION TO BE DECIDED

Start with the whole. Learn by changing the parts.

APPDEV NEXT STEP – TBD

A DIFFERENT WAY TO BUILD WITH AI

Your idea. Your code. Built in conversation.

First Draft slows down the part worth slowing down: deciding what your app should do. Then it turns the plan into a working foundation you can understand, own, and keep building.

Explore the workshop

PLAN FIRSTORDINARY SOURCEWEB + NATIVEYOUR REPOSITORY

A REAL APPLICATION, NOT A PRETTY DEAD END

A demo can look finished. The hard parts are underneath.

A static site displays pages. A real app remembers people and data, enforces rules, runs workflows, and changes over time.

PLAN MORE THAN YOU THINK

A good agent should challenge the idea— not just agree with it.

SCROLL / SCRUB
Questions accumulate.
The plan gets sharper.

ONE FOUNDATION, MANY SURFACES

The line does not disappear into a dozen services.

A reviewed plan becomes a conventional application foundation: web, data, tests, and selected native projects—connected by code you can inspect.

IT IS YOUR IDEA. IT IS YOUR CODE.

Nothing important is hidden behind the preview.

Your repository is the source of truth. Open the files. Read the tests. Ask your agent why a decision was made. Change the code with any developer or coding agent you choose.

First Draft gives you a strong beginning—not a new landlord.

BUILD THIS WAY, TOGETHER

Come with an idea. Leave with a foundation—and the reasoning behind it.

The workshop makes room for the part most tools skip: asking better questions, choosing what belongs in the first version, and understanding what gets built.

Workshop details coming soon
